EKNS/DKNS

EKN/DKN

Vorteile

- > schnelle Montage an 20 mm-Normflansch
- > in allen Einbaulagen einsetzbar
- > transformatorisch und elektronisch stufenlos regelbar
- > serienmäßig mit Motorvollschutz durch Thermokontakte ausgerüstet (bei Ex-Motoren mit Kaltleitern)
- > extrem niedriger Anlaufstrom
- > kompakte, raumsparende Bauart

Eigenschaften und Ausführung

Der Kanalventilator vereint die Vorteile des Axialventilators - die gerade Durchströmung - mit der hohen Druckstabilität, dem niedrigen Schallniveau und dem ausgezeichneten Wirkungsgrad des Radialventilators.

Gehäuse

- > EKN, DKN - Gehäuse aus verzinktem Stahlblech als rechteckiger Luftkanal ausgebildet, mit Norm-Luftkanalflanschen (20 mm breit) druck- und saugseitig.
- > EKNS, DKNS - mit Gehäuserahmen aus Aluminiumstrangpreßprofil und Kunststoffecken aus glasfaserverstärktem Polyamid. Abdeckungen aus verzinktem Blech mit innenliegenden Schalldämmatten aus Elastomerschaum.

Lauftrad

Vorwärts gekrümmte Radiallaufräder aus Stahlblech.

Die Laufräder sind direkt auf die Rotoren der Außenläufermotoren aufgebaut und zusammen mit diesen entsprechend Gütestufe G 2,5 nach DIN ISO 1940 auf zwei Ebenen gewuchtet.

Elektrischer Anschluss

Die Motoren sind auf einen außen am Gehäuse angebrachten Klemmkasten verdrahtet.

Luftleistungskennlinien

Die Kennlinien für diese Typenreihe wurden mit einem saugseitigen Kammerprüfstand entsprechend der DIN 24 163 in Einbauart D (saug- und druckseitig angeschlossen) gemessen und zeigen die statische Druckerhöhung Δp_{st} als Funktion des Volumenstroms. Die dynamische Druckerhöhung Δp_{d2} ist auf den Flanschquerschnitt des Ventilatorgehäuses bezogen.

Schallentwicklung

In den Luftleistungskennlinien ist der A-bewertete Freiausblas-Schalleistungspegel L_{WA6} angegeben.

Der A-bewertete Freiansaug-Schalleistungspegel L_{WA5} nach DIN 45 635, Teil 38 kann über die relativen Schalleistungspegel genau ermittelt werden, oder nach folgender Berechnung näherungsweise bestimmt werden:

$$L_{WA5} \approx L_{WA6} - 6 \text{ dB(A)}$$

Der A-bewertete Gehäuse-Schalleistungspegel L_{WA2} nach DIN 45 635, Teil 38 kann über die relativen Schalleistungspegel genau ermittelt werden, oder nach folgender Berechnung näherungsweise bestimmt werden:

$$L_{WA2} \approx L_{WA6} - 17 \text{ dB(A)} \text{ - für EKN oder DKN}$$

$$L_{WA2} \approx L_{WA6} - 25 \text{ dB(A)} \text{ - für EKNS oder DKNS}$$

Den A-bewerteten Schalldruckpegel L_{PA} in 1m Abstand erhält man annähernd, indem man vom A-Schalleistungspegel 7 dB(A) abzieht:

$$L_{PA(1m)} \approx L_{WA2} - 7 \text{ dB(A)}$$

Um Körperschallübertragungen auf ein angeschlossenes Kanalsystem zu vermeiden empfehlen wir den Einsatz unserer flexiblen Kanalverbindungsstücke EVK/EVKN (siehe Seite 28). Für genauere Berechnungen bei Schallschutzmaßnahmen ist der Schalleistungspegel der Oktavbänder (A-bewertet) von Bedeutung, welcher wie folgt ermittelt wird:

$$L_{WAokt} = L_{WA6} + L_{WArel}$$

Die relativen A-bewerteten Oktav-Schalleistungspegel L_{WArel} bei den Oktav-Mittelfrequenzen sind der Tabelle auf der vorhergehenden Seite zu entnehmen, sie sind bei $0,5 \times V_{max}$ ermittelt worden.

Advantages

- > easy installation via 20 mm standard flange
- > fans can be installed in any position
- > 100% speed controllable by auto transformer or electronic controller
- > motor protection by thermal contacts as standard (Explosion-proof motors with PTC thermistors)
- > extremely low starting currents
- > compact design

Design features

Duct fans combine the advantages of axial fans, straight airflow and easy installation, with those of centrifugal fans, such as high pressure stability, low noise level and high efficiency.

Casing

- > EKN, DKN - Casing made of galvanised sheet steel formed as a rectangular air duct, with standard tube flanges (20 mm width) at inlet and outlet sides.
- > EKNS, DKNS - aluminium profile and plastic corners made from reinforced polyamide. Panels are made from galvanised sheet steel with sound absorbing insulation made of elastomeric foam.

Impeller

Forward-curved centrifugal impellers made of sheet steel or plastic.

The impellers are fitted directly onto the rotor of the external rotor motor. The motorized impellers are balanced at two levels according to G 2.5 (DIN ISO 1940).

Electrical connection

The motors are wired to an external terminal box.

Fan performance curves

The performance curves of these fans have been established using a test chamber according to DIN 24 163, mounting position D (connected at both sides). The curves indicate the static pressure increase Δp_{st} as a function of the volume flow. The dynamic pressure increase Δp_{d2} shown in the performance curves refers to the flange cross-sectional area of the fan housing.

Sound levels

The figures given in the performance curves represent the A-weighted sound power levels L_{WA6} in decibel at the outlet side in duct systems. The A-weighted sound power level at the inlet side L_{WA5} , according to DIN 45 635, part 38, can be calculated via the relative sound power levels or can be obtained by the following approximation calculation:

$$L_{WA5} \approx L_{WA6} - 6 \text{ dB(A)}$$

The A-weighted sound power level radiated from the casing L_{WA2} , according to DIN 45 635, part 38, can be calculated via the relative sound power levels (see below) or is obtained approximately as follows:

$$L_{WA2} \approx L_{WA6} - 17 \text{ dB(A)} \text{ - for EKN or DKN}$$

$$L_{WA2} \approx L_{WA6} - 25 \text{ dB(A)} \text{ - for EKNS or DKNS}$$

The A-weighted sound pressure level L_{PA} at a distance of 1 metre is obtained approximately by deducting 7 dB(A) from the A-weighted sound power level.:

$$L_{PA(1m)} \approx L_{WA2} - 7 \text{ dB(A)}$$

It is important to note that reflexion and environmental characteristics as well as resonant frequencies influence the sound pressure levels in different ways. In order to avoid structure-borne noise transfer to a connected duct system we recommend the use of flexible connections EVK/EVKN (see page 28). The A-weighted octave sound power level is important for the choice of suitable sound attenuators. It is obtained as follows:

$$L_{WAokt} = L_{WA6} + L_{WArel}$$

The relative A-weighted octave sound power level L_{WArel} at octave medium frequency can be taken from the table on the preceding page. These levels have been established at $0,5 \times V_{max}$.
